program designer. So there tends to be two modes, one for newbies , marketing guys etc ie.

Basic mode; And second for expert programmers or developer, ie. Expert mode. So a software

will go from basic to experts mode on a button click.

I am thinking of creating the above software. Hence i got interested in your mail. One

thing is clear, every language has many common features, this means they can be described

without the programming language itself, which says we should be able to make them into

some GUI based programming language without coding.

I had seen "Google Sketch up" couple of years ago, it can create nice 3D worlds that

anyone who can uses paintbrush can use with little a training; It cant be used for

Engineering purposed. Something similar can be developed for programming by computer

users.
