

The WannaCry Malware Attack

Dear all,

This alert is to provide guidance regarding malware variously named WannaCrypt, WannaCry, WannaCryptor, or Wcry. Please share this with your IT and Security teams to ensure they are fully aware, prepared and protecting your organization against the attack.

On May 12, 2017, many of our customers around the world and the critical systems they depend on were victims of malicious “WannaCrypt” software. Microsoft is working to ensure we are taking all possible actions to protect our customers. Below we have given further details of the threat and steps every individual and business should take to stay protected. Additionally, we are taking the highly unusual step of providing a security update for all customers to protect Windows platforms that are in custom support only, including [Windows XP, Windows 8, and Windows Server 2003](#). Customers running Windows 10 were not targeted by the attack today.

In March, we released a security update which addresses the vulnerability that these attacks are exploiting. Unfortunately, the malware appears to have affected computers that have not applied the patch for these vulnerabilities. While the attack is unfolding, we remind users to install [MS17-010](#) if they have not already done so. Microsoft antimalware telemetry constantly monitors for such threats, and alerted us to this attack. These systems gave us the visibility and context around the attack, allowing [Windows Defender Antivirus](#) to deliver real-time defense. Through automated analysis, machine learning, and predictive modeling, we were able to protect many up-to-date systems against this malware.

[Steps to prevent and protect against this threat](#)

To get the latest protection from Microsoft, upgrade to [Windows 10](#). Keeping your computers [up-to-date](#) gives you the benefits of the latest features and proactive mitigations built into the latest versions of Windows.

We recommend customers that have not yet installed the security update [MS17-010](#) do so as soon as possible. Until you can apply the patch, we also recommend two possible workarounds to reduce the attack surface:

- Disable SMBv1 with the steps documented at [Microsoft Knowledge Base Article 2696547](#) and as [recommended previously](#) (Reboot Required)
- Consider adding a rule on your router or firewall to block incoming SMB traffic on port 445

[Windows Defender Antivirus](#) detects this threat as [Ransom:Win32/WannaCrypt](#) as of the 1.243.297.0 update. Enable Windows Defender Antivirus to detect this ransomware. Windows Defender Antivirus uses cloud-based protection, helping to protect you from the latest threats.

Use [Office 365 Advanced Threat Protection](#), which has machine learning capability that blocks dangerous email threats, such as the emails carrying ransomware.

Monitor your network with [Windows Defender Advanced Threat Protection](#), which alerts security operations teams about suspicious activities. Download this playbook to see how you can leverage Windows Defender ATP to detect, investigate, and mitigate ransomware in networks: [Windows Defender Advanced Threat Protection – Ransomware response playbook](#).

For enterprises, use [Device Guard](#) to lock down devices and provide kernel-level virtualization-based security, allowing only trusted applications to run, effectively preventing malware from running.

Below are [Frequently Asked Questions](#) to help you further understand the nature of this malware attack, and to answer some of the questions you might have. For more information on support options please visit our support site: <https://support.microsoft.com/en-us/gp/support-options-for-business>

In case you have any further questions or require any assistance from our side, please do not hesitate to let me know.

Regards,

----- Add your Signature -----

Frequently Asked Questions

1. Question: [What is WannCrypt Ransomware and How does it attack my environment?](#)
2. Question: [How does the virus enter my systems?](#)
3. Question: [How does WannaCry takes control over my system?](#)
4. Question: [How does the virus spread further into my systems?](#)
5. Question: [What are the necessary steps to prevent from the attack?](#)
6. Question: [What Microsoft Malware Detection Tools can I use?](#)
7. Question: [Where Do I find an additional resources?](#)

Attack vector

A ransomware threat does not normally spread so rapidly. Threats like WannaCrypt typically leverage social engineering or emails as primary attack vector, relying on users downloading and executing a malicious payload. However, in this unique case, the ransomware perpetrators incorporated publicly-

available exploit code for the patched SMB EternalBlue vulnerability, [CVE-2017-0145](#), which can be triggered by sending a specially crafted packet to a targeted SMBv1 server, was fixed in security bulletin [MS17-010](#), released on March 14, 2017.

WannaCrypt's spreading mechanism is borrowed from [well-known public SMB exploits](#), which armed this regular ransomware with worm-like functionalities, creating an entry vector in machines still unpatched even after the fix had become available.

The exploit code used by WannaCrypt was designed to work only against unpatched Windows 7 and Windows Server 2008 (or earlier OS) systems, so Windows 10 PCs are not affected by this attack.

We haven't found evidence of the exact initial entry vector used by this threat, but there are two scenarios we believe are highly possible for this ransomware family:

- Arrival through social engineering emails designed to trick users to run the malware and activate the worm-spreading functionality with the SMB exploit
- Infection through SMB exploit when an unpatched computer can be addressed in other infected machines

Dropper

The threat arrives as a dropper Trojan that has the following two components:

- Ccomponent that tries to exploit the SMB EternalBlue vulnerability in other computers
- Ransomware known as WannaCrypt

The dropper tries to connect the following domain using the API InternetOpenUrlA():

```
hxxp://www[.]juqerfsodp9ifjaposdfjhgosurijfaewrwergwea[.]com
```

If connection is successful, the threat does not infect the system further with ransomware or try to exploit other systems to spread; it simply stops execution. However, if the connection fails, the dropper proceeds to drop the ransomware and creates a service on the system.

In other words, blocking the domain with firewall either at ISP or enterprise network level will cause the ransomware to continue spreading and encrypting files.

```

mov     esi, eax
push   0           ; lpzHeaders
push   ecx         ; http://www.iugerfsodp9ifja
push   esi         ; hInternet
call   ds:InternetOpenUrlA
mov     edi, eax
push   esi         ; hInternet
mov     esi, ds:InternetCloseHandle
test   edi, edi
jnz    short exit
call   esi ; InternetCloseHandle
push   0           ; hInternet
call   esi ; InternetCloseHandle
call   dropper_main
pop    edi
xor    eax, eax
pop    esi
add    esp, 50h
retn   10h

; -----
exit:
; CODE XREF: WinMain(x,x,x,x)
call   esi ; InternetCloseHandle
push   edi         ; hInternet
call   esi ; InternetCloseHandle

```

The threat creates a service named mssecsvc2.0, whose function is to exploit the SMB vulnerability in other computers accessible from the infected system:

Service Name: mssecsvc2.0

Service Description: (Microsoft Security Center (2.0) Service)

Service Parameters: "-m security"

```

push    offset Format    ; "%s -m security"
push    eax              ; Dest
call    ds:sprintf
add     esp, 0Ch
push    0F003Fh         ; dwDesiredAccess
push    0                ; lpDatabaseName
push    0                ; lpMachineName
call    ds:OpenSCManagerA
mov     edi, eax
test    edi, edi
jz     short loc_407CCA
push    ebx
push    esi
push    0                ; lpPassword
push    0                ; lpServiceStartName
push    0                ; lpDependencies
push    0                ; lpdwTagId
lea    ecx, [esp+120h+Dest]
push    0                ; lpLoadOrderGroup
push    ecx              ; lpBinaryPathName
push    1                ; dwErrorControl
push    2                ; dwStartType
push    10h              ; dwServiceType
push    0F01FFh         ; dwDesiredAccess
push    offset DisplayName ; "Microsoft Security Center (2.0) Ser
push    offset ServiceName ; "mssecsvc2.0"
push    edi              ; hSCManager
call    ds:CreateServiceA
mov     ebx, ds:CloseServiceHandle
mov     esi, eax

```

WannaCrypt ransomware

The ransomware component is a dropper that contains a password-protected archive in its resource section. The document encryption routine and the files in the .zip archive contain support tools, a decryption tool, and the ransom message. In the samples we analyzed, the password for the .zip archive is "WNcry@2o17".

When run, WannaCrypt creates the following registry keys:

- HKLM\SOFTWARE\Microsoft\Windows\CurrentVersion\Run\<random string> = "<malware working directory>\tasksche.exe"
- HKLM\SOFTWARE\WanaCrypt0r\wd = "<malware working directory>"

It changes the wallpaper to a ransom message by modifying the following registry key:

- HKCU\Control Panel\Desktop\Wallpaper: "<malware working directory>\@WanaDecryptor@.bmp"

It creates the following files in the malware's working directory:

- 00000000.eky
- 00000000.pky
- 00000000.res
- 274901494632976.bat
- @Please_Read_Me@.txt
- @WanaDecryptor@.bmp
- @WanaDecryptor@.exe

WannaCrypt may also create the following files:

- %SystemRoot%\tasksche.exe
- %SystemDrive%\intel\<random directory name>\tasksche.exe
- %ProgramData%\<random directory name>\tasksche.exe

It may create a randomly named service that has the following associated ImagePath: "cmd.exe /c "<malware working directory>\tasksche.exe"

Then it searches the whole computer for any file with any of the following file name extensions: .123, .jpeg, .rb, .602, .jpg, .rtf, .doc, .js, .sch, .3dm, .jsp, .sh, .3ds, .key, .sldm, .3g2, .lay, .sldm, .3gp, .lay6, .sldx, .7z, .ldf, .slk, .accdb, .m3u, .sln, .aes, .m4u, .snt, .ai, .max, .sql, .ARC, .mdb, .sqlite3, .asc, .mdf, .sqlitedb, .asf, .mid, .stc, .asm, .mkv, .std, .asp, .mml, .sti, .avi, .mov, .stw, .backup, .mp3, .suo, .bak, .mp4, .svg, .bat, .mpeg, .swf, .bmp, .mpg, .sxc, .brd, .msg, .sxd, .bz2, .myd, .sxi, .c, .myi, .sxm, .cgm, .nef, .sxw, .class, .odb, .tar, .cmd, .odg, .tbk, .cpp, .odp, .tgz, .crt, .ods, .tif, .cs, .odt, .tiff, .csr, .onetoc2, .txt, .csv, .ost, .uop, .db, .otg, .uot, .dbf, .otp, .vb, .dch, .ots, .vbs, .der", .ott, .vcd, .dif, .p12, .vdi, .dip, .PAQ, .vmdk, .djvu, .pas, .vmx, .docb, .pdf, .vob, .docm, .pem, .vsd, .docx, .pfx, .vsdx, .dot, .php, .wav, .dotm, .pl, .wb2, .dotx, .png, .wk1, .dwg, .pot, .wks, .edb, .potm, .wma, .eml, .potx, .wmv, .fla, .ppam, .xlc, .flv, .pps, .xlm, .frm, .ppsm, .xls, .gif, .ppsx, .xlsb, .gpg, .ppt, .xlsm, .gz, .pptm, .xlsx, .h, .pptx, .xlt, .hwp, .ps1, .xltm, .ibd, .psd, .xltx, .iso, .pst, .xlw, .jar, .rar, .zip, .java, .raw

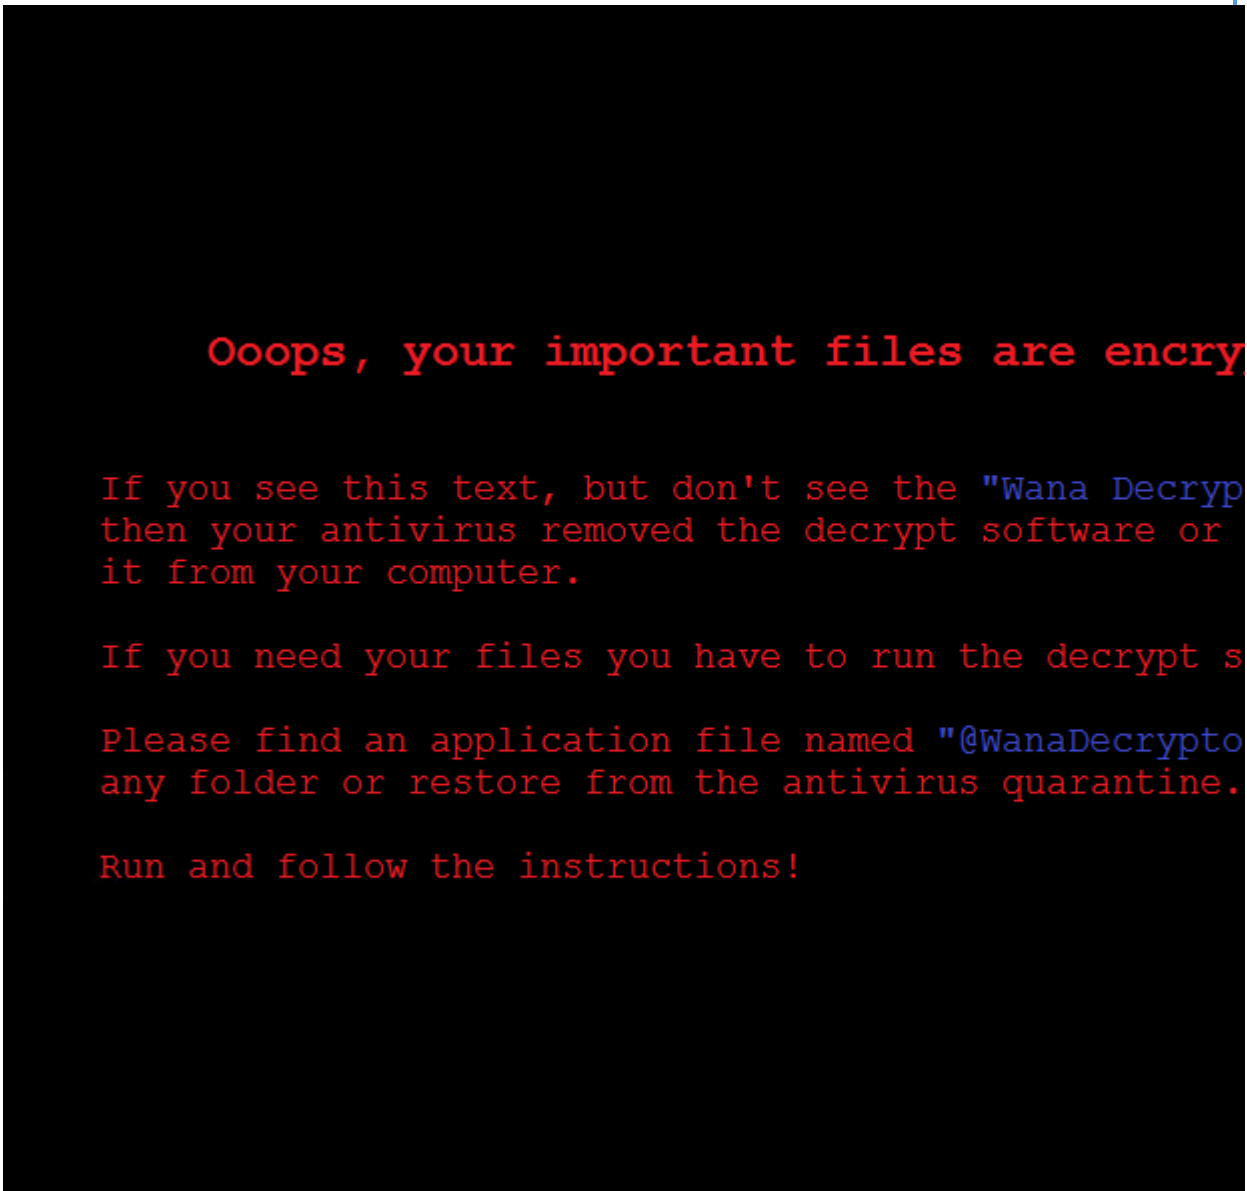

WannaCrypt encrypts all files it finds and renames them by appending ".WNCRY" to the file name. For example, if a file is named "picture.jpg", the ransomware encrypts and renames to "picture.jpg.WNCRY".

This ransomware also creates the file "@Please_Read_Me@.txt" in every folder where files are encrypted. The file contains the same ransom message shown in the replaced wallpaper image (screenshot below).

After completing the encryption process, the malware deletes the volume shadow copies by running the following command:

```
cmd.exe /c vssadmin delete shadows /all /quiet & wmic shadowcopy delete & bcdedit /set {default} bootstatuspolicy ignoreallfailures & bcdedit /set {default} recoveryenabled no & wbadmin delete catalog -quiet
```

It then replaces the desktop background image with the following message:

It also runs an executable showing a ransom note which indicates a \$300 ransom and a timer:

Ooops, your files have been encrypted

Payment will be raised on

5/15/2017 16:50:06

Time Left

02:23:34:22

Your files will be lost on

5/19/2017 16:50:06

[About bitcoin](#)

[How to buy bitcoins?](#)

[Contact Us](#)

What Happened to My Computer?

Your important files are encrypted.

Many of your documents, photos, videos, databases and other files are encrypted because they have been encrypted. Maybe you are busy looking for files, but do not waste your time. Nobody can recover your files without our service.

Can I Recover My Files?

Sure. We guarantee that you can recover all your files safely and in enough time.

You can decrypt some of your files for free. Try now by clicking on the links. But if you want to decrypt all your files, you need to pay.

You only have 3 days to submit the payment. After that the price will be raised. Also, if you don't pay in 7 days, you won't be able to recover your files. We will have free events for users who are so poor that they cannot pay.

How Do I Pay?

Payment is accepted in Bitcoin only. For more information, click on the links. Please check the current price of Bitcoin and buy some bitcoins. <How to buy bitcoins>.

And send the correct amount to the address specified in this window. After your payment, click <Check Payment>. Best time to check payment is from Monday to Friday.

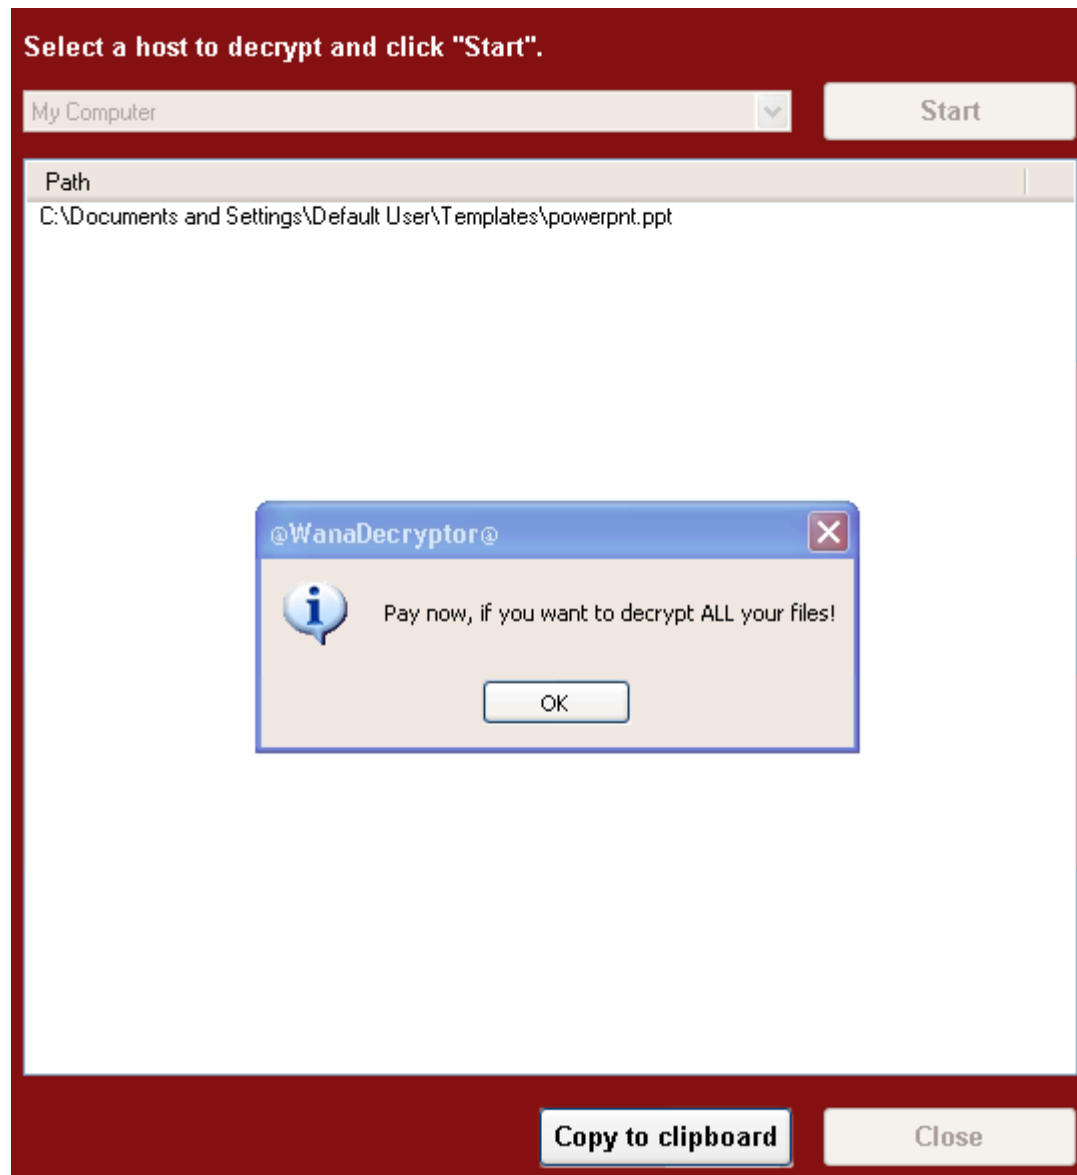

Send \$300 worth of bitcoin to this

Check Payment

The text is localized into the following languages: Bulgarian, Chinese (simplified), Chinese (traditional), Croatian, Czech, Danish, Dutch, English, Filipino, Finnish, French, German, Greek, Indonesian, Italian, Japanese, Korean, Latvian, Norwegian, Polish, Portuguese, Romanian, Russian, Slovak, Spanish, Swedish, Turkish, and Vietnamese.

The ransomware also demonstrates the decryption capability by allowing the user to decrypt a few random files, free of charge. It then quickly reminds the user to pay the ransom to decrypt all the remaining files.

Spreading capability

The worm functionality attempts to infect unpatched Windows machines in the local network. At the same time, it also executes massive scanning on Internet IP addresses to find and infect other vulnerable computers. This activity results in large SMB traffic from the infected host, which normally can be observed by SecOps personnel, as shown below.

The screenshot shows a Wireshark interface with a filter set to 'tcp && tcp.dstport==445'. The packet list pane shows several TCP connections to various IP addresses in the 157.x.x.x range. A red box highlights the destination IP addresses: .157.11, .157.12, .157.12, .157.13, .157.13, .157.14, and .157.15.

No.	Time	Source	Destination	Proto
200618	217.566696		.157.11	TCP
202094	218.633911		.157.12	TCP
203140	219.441199		.157.12	TCP
203455	219.695544		.157.13	TCP
204356	220.488082		.157.13	TCP
204779	220.800093		.157.14	TCP
206453	221.883475		.157.15	TCP

The packet details pane shows the selected packet (No. 203140) with the following structure:

- Frame 199031: 66 bytes on wire (528 bits), 66 bytes captured (528 bits) on interface 0
- Ethernet II, Src: [redacted], Dst: All
- Internet Protocol Version 4, Src: [redacted], Dst: [redacted].157.12
- Transmission Control Protocol, Src Port: 50041, Dst Port: 445, Seq: [redacted], Win: 0, Len: 0
 - Source Port: 50041
 - Destination Port: 445

The Internet scanning routine randomly generates octets to form the IPv4 address and targets that IP to attempt exploitation of CVE-2017-0145. The threat avoids infecting the IPv4 address if the randomly generated value for first octet is 127 or if the value is equal to or greater than 224, in order to skip local loopback interfaces. Once a vulnerable machine is found and infected, it becomes the next hop to infect other machines. The vicious infection cycle continues as the scanning routing discovers unpatched computers.

When it successfully infects a vulnerable computer, the malware runs kernel-level shellcode which seems to have been copied from the public backdoor known as DOUBLEPULSAR, but with certain adjustments to drop and execute the ransomware dropper payload, both for x86 and x64 systems.
